

(a) Schedule the machines

the vehicle is not an input

J1 due at t

J2 due at $t+1$

Two transfers one time unit apart;
transport is assumed to be free.

(b) Dispatch the vehicle

the plan can no longer change

no vehicle free for J1

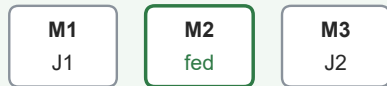

J2 served

Only one transfer can be served.
M2 starves; later blocks shift.

(c) Decide both in one chain

the plan already knows the fleet

one tour: J1 then J2

One tour serves both transfers;
no machine goes idle.
